

Thesis: My thesis is that Canada is the top dog in the world of winter olympics

Intend to prove: That on a metric where gold medals are worth 3 points, silver are worth 2 points and bronze are worth 1 point, Canadian athletes will garner the most points between both men and women.

Data Analysis: I intend to total the medals that athletes from each country have earned and determine their points.

Charts: Charts to show the top 5 countries in bronze, then 5 more for silver, 5 more again for gold. Then a final chart of the top 5 countries point total

Why these charts are the best way to outline my point: Each tier of medal means more than the last, so affording a gold more than a silver and so on makes sense to me. This method also eliminates a country coming out on top just by sheer number of athletes.
